CHAPTER 1

Introduction to economics

The complete NIOS Senior Secondary Economics course: microeconomics, macroeconomics, the Indian economy and statistics for economics. Written for self-study, with learning objectives, worked numericals and model question papers.

Read the question twice before you write anything. Most marks are lost not because the student did not know the answer, but because they answered a slightly different question. Underline what is being asked. Then, and only then, begin.

Work through the example in the margin with a pencil, covering the solution with your hand and checking one line at a time. If you can predict the next line, you understand the method. If you cannot, read the explanation again; it is written to be read more than once.

Practice is not the same as repetition. Repetition is doing the same sum ten times. Practice is doing ten different sums that use the same idea, until the idea is yours and the sums no longer matter.

At the end of each section there is a short set of exercises. Do them without looking back at the text. Mark your own work honestly using the key at the back. A wrong answer that you understand is worth more than a right answer that you guessed.

Keep a page at the back of your notebook for mistakes. Write the question, what you did, and what you should have done. Before any test, read that page instead of the whole book. It is the shortest and most useful chapter you will ever write.

When you are ready, close the book, set a timer for forty minutes and attempt the practice paper as if it were the real one. Then open the book again. The purpose of the paper is not to score; it is to find out what to read next.

Read the question twice before you write anything. Most marks are lost not because the student did not know the answer, but because they answered a slightly different question. Underline what is being asked. Then, and only then, begin.

Work through the example in the margin with a pencil, covering the solution with your hand and checking one line at a time. If you can predict the next line, you understand the method. If you cannot, read the explanation again; it is written to be read more than once.

At the end of each section there is a short set of exercises. Do them without looking back at the text. Mark your own work honestly using the key at the back. A wrong answer that you understand is worth more than a right answer that you guessed.

Keep a page at the back of your notebook for mistakes. Write the question, what you did, and what you should have done. Before any test, read that page instead of the whole book. It is the shortest and most useful chapter you will ever write.

When you are ready, close the book, set a timer for forty minutes and attempt the practice paper as if it were the real one. Then open the book again. The purpose of the paper is not to score; it is to find out what to read next.

Read the question twice before you write anything. Most marks are lost not because the student did not know the answer, but because they answered a slightly different question. Underline what is being asked. Then, and only then, begin.

Work through the example in the margin with a pencil, covering the solution with your hand and checking one line at a time. If you can predict the next line, you understand the method. If you cannot, read the explanation again; it is written to be read more than once.

Practice is not the same as repetition. Repetition is doing the same sum ten times. Practice is doing ten different sums that use the same idea, until the idea is yours and the sums no longer matter.

At the end of each section there is a short set of exercises. Do them without looking back at the text. Mark your own work honestly using the key at the back. A wrong answer that you understand is worth

more than a right answer that you guessed.
